Data Science : Seminars and Challenge

The 2026–2027 challenge is proposed by the company EasyVista.

Easyvista, based in Noisy-le-Grand and Grenoble, designs, develops, and markets innovative software solutions dedicated to IT Service Management (ITSM) and Enterprise Service Management (ESM). With an international presence, the company supports organizations in transforming and optimizing their IT and business processes. By placing data governance and artificial intelligence at the heart of its strategy, Easyvista helps companies improve performance, agility, and resilience in the face of today's technological challenges.

Among its flagship solutions, EV Service Manager stands out as a comprehensive ITSM/ESM platform, aligned with ITIL best practices and enhanced with intelligent automation features. Designed to effectively align support and operations teams, this software suite provides unified visibility and intelligent management of the IT ecosystem.

EV Observe is our advanced IT monitoring solution, designed for medium-sized to large enterprises as well as MSPs with complex IT environments. Thanks to our unique "IT Services Weather" visualization, EV Observe transforms raw IT data into actionable insights, enabling teams to instantly see what is operational, what is at risk, and what requires action.

EV Reach is Easyvista's remote support solution. It is designed to deliver proactive IT service through detailed endpoint insights, simplified system management, and advanced automation. Integrated with ITSM workflows, EV Reach enables support teams to act with agility, automate routine tasks, and resolve issues quickly before they impact productivity.

The R&D department has a dedicated Global AI team focused on research and innovation. To date, we have supervised two CIFRE PhD theses, defended in 2021 by Karim-Charles Assaad and in 2024 by Lei Zan. We have also supervised several Master's research students — more than 10 — on topics related to time series, including anomaly detection, forecasting, missing value processing, causal discovery, and causal reasoning, and more recently on textual data, including LLMs, RAG, root cause analysis, and impact analysis.

The Data Challenge will begin on **November 2, 2026, from 1:30 PM to 4:45 PM, in room F108 of the UFR IM2AG**.

Title : Service Level Agreement prevision in ITSM

Description:

In modern IT Service Management systems, support teams handle large volumes of tickets related to incidents, service requests, technical problems, and user assistance. Each ticket is usually associated with a **Service Level Agreement**, or SLA, which defines the maximum acceptable response or resolution time. Failing to respect an SLA can lead to operational risks, customer dissatisfaction, financial penalties, and loss of trust.

In this data challenge, M2 students in Data Science will work with real-world data extracted from an ITSM support system. The objective is to analyze historical support tickets and develop predictive models that can help anticipate SLA violations and estimate ticket resolution times.

The challenge combines exploratory data analysis, state-of-the-art review, benchmarking, and predictive modeling. Students are expected to study existing approaches in ITSM analytics, ticket classification, SLA prediction, and time-to-resolution modeling, then compare several machine learning or statistical methods on the provided dataset.

Main Objectives:

Students will address two main prediction tasks:

1. SLA Violation Prediction

Given the information available for a ticket, predict whether its SLA will be violated or not.

This is a binary classification problem where the target variable indicates whether the ticket was resolved within the agreed SLA deadline.

Example question: Will the SLA of this ticket be respected or violated?

2. Resolution Time Prediction Predict the time required to resolve a ticket.

This is a regression prediction problem where the objective is to estimate the duration between ticket creation and ticket resolution.

Example question: How long will it take for this ticket to be resolved?
